Search 4GW - and other Beta software, is a search engine for OS X that uses algorithms to help users find the software they're looking for on your computer. It doesn't just search your Home folder, but everything that is installed on your computer.

Q: Selecting rows from column based on a given criteria in pandas If I have a dataset like this:

```
+-----+-----+ | id | proptype |
+-----+-----+ | 1 | A | | 2 | A | | 3 | B | | 4 | B | | 5 | B | +-----+-----+
```

How would I select the rows with the same proptype? In this case, there are two row, so I should get:

```
+-----+-----+ | id | proptype | +-----+-----+ | 2 | A | | 5 | B |
+-----+-----+
```

I know that I can make a list and use the.isin(list) function to select this condition, but I was wondering if there was a better way? A: You can use groupby and having with id converted to numeric and chained with groupby.transform:

```
m = df['proptype'].map(lambda x: x.astype(int).astype(str))
print (m) 0 A 1 A 2 B 3 B Name: proptype, dtype: object
print (m.groupby(m).transform('sum').ne(0).sum()) id 2 1 5 1 dtype: int64
```
